

Cyclic Optimization of Floating L Tones in Kikuyu *

Siri Gjersøe

Leipzig University

1. Introduction

This study discusses the puzzling pattern of downstep ([↓]) in Kikuyu (Bantu, E51). Kikuyu is a tone language with a /H L Ø/ tonal distinction which attests underlying floating L tones of lexical and phrasal nature. These two tones are domain-sensitive and their input-output derivation gives evidence for cyclicity. The domain of the floating tones is the p(honological)-phrase and downstep appears preferably at the right edge of a p-phrase. Interestingly, the positioning of downstep is also determined by surrounding tones as the sequence H[↓]L is banned. The puzzling part is that the phrasal floating L tone moves away from its underlying position towards its preferred realization site of a p-phrase edge and this happens even in contexts where the floating L tone can not be realized in this position due to markedness reasons. It can therefore end up triggering downstep in a p-phrase medial position which deviates from its underlying position. This pattern poses a challenge to standard monostratal parallel Optimality Theory and argues for a serial derivation. The proposal here is a Stratal OT analysis with two strata above the word level. The first stratum derives the positioning of the floating L tones according to the p-phrase edge. The second stratum derives an interaction between the floating L tones and High Tone Spreading (HTS). The analysis predicts that L tone deletion followed by unbounded HTS works as a repair mechanism which allows the floating L tone to move without undergoing tonal metathesis. The analysis is based on new data recorded in Berlin in 2014.

2. Domain of downstep

Firstly, the inspiration for this work comes from the excellent studies by Clements & Ford (1981) and Clements (1984) who propose a ruled-based analysis of downstep in Kikuyu. Secondly, this paper builds on Gjersøe (2016) who proposes an analysis of downstep in

*I would like to thank the two Kikuyu speakers I worked with: Anna Maria Nginah and Shaleen Mwangi. I am also grateful for feedback and valuable insights by Eva Zimmermann, for comments on earlier versions on this work by Hubert Truckenbrodt, and for useful remarks by the ROA staff.

Kikuyu within the end-based approach of the syntax-phonology interface (cf. Selkirk 1995, Truckenbrodt 1999, among others). The proposed domain of downstep in Kikuyu is the p-phrase (ϕ) which in the prosodic hierarchy corresponds to the maximal phrase (XP). The p-phrase in Kikuyu is determined by the ranking $\text{ALIGN}(\text{XP}, \text{R}; \phi, \text{R}) \gg *P\text{-PHRASE}$.^{1,2} This ranking predicts that every maximal phrase of a lexical category triggers a p-phrase boundary. More concretely, a noun and an adjacent modifier, and a verb and a following object form one p-phrase, while a subject, a secondary object or an adjunct which follows a primary object form a separate p-phrase. In coordination, the conjunction triggers a p-phrase boundary.

Downstep is triggered by a floating L tone ($\textcircled{\text{L}}$) which can either be lexical or phrasal. It can trigger downstep on both H and L tones and the three following configurations are attested: (i) $\text{H}_\phi \uparrow \text{H}$; (ii) $\text{L}_\phi \uparrow \text{H}$; (iii) $\text{L}_\phi \uparrow \text{L}$. The lexical floating L tone appears final in certain nouns as in *mondò* (1). P-phrase-medial it gets deleted as in (1) where an adjective follows the noun. Downstep is triggered when $\textcircled{\text{L}}$ is positioned at the right-edge of a p-phrase. This is shown in (2) where $\textcircled{\text{L}}$ in *mondò* triggers downstep on the initial L-toned syllable of the verb. Note that in (2), binary HTS applies from the verb onto the object. It is assumed that H, L and \emptyset tones are underlying specified in Kikuyu and underlying toneless syllables like the noun class prefix receive a default L on the surface (cf. Gjersøe 2015).

The example in (2) also shows another floating L tone marked in bold which follows the verb underlyingly. This is the phrasal $\textcircled{\text{L}}$ which appears final in verbs of assertions (cf. Clements (1984), Gjersøe (2015, 2016)). Just as the lexical $\textcircled{\text{L}}$, the phrasal $\textcircled{\text{L}}$ can trigger downstep on a syllable to its right. The data in (3) shows that p-phrase-medial, $\textcircled{\text{L}}$ does not trigger downstep. Instead, downstep appears at the right edge of the p-phrase. In (3a), downstep appears on the secondary object *βìrìβìrì*. In (3b), the verb and the modified nominal object form one p-phrase. Downstep appears on the L-initial syllable of the adverb *rosíně*. In (3c), the object is a coordination where the first noun forms a p-phrase with the verb while the conjunction *nà* triggers a new p-phrase boundary. Downstep appears on *nà*.

|-----|---|-----------------------------|

¹ A high ranking of $\text{ALIGN}(\text{XP}, \text{R})$ for Kikuyu downstep has also been suggested by Selkirk (2000).

² The constraint $*P\text{-PHRASE}$ is taken from Truckenbrodt (1999) and bans the formation of p-phrases.

³ All examples without a reference are from own recordings. The underlying tones (H: $\acute{\text{V}}$, L: $\grave{\text{V}}$ or toneless V) are shown in the first line of the glossed example and surface tones are shown in the second line. The syllable is the TBU. Abbreviations for the glossings follow the Leipzig Glossing rules. Exception are: FV – final vowel, NPST – near past, and SM – subject marker.

Cyclic Optimization of floating L tones in Kikuyu

- b. /ndò:niré(L) morèmi(L) moritò(L) ro:síně/
 (nd-ò:n-iré mó-rèmi mò-rìtò)_φ (⁺rò:s-íně)_φ
 SM-see-PFV.FV 1-farmer 1-ugly 11-morning
 ‘I saw the ugly farmer this morning.’
- c. /ndèrà:rórìrè(L) mwànèkì(L) nà nǝðyóná(L)/

 SM-NPST-watch-PFV.FV Mwanĩki and Njũguna
 ‘I watched Mwanekĩ and Njũguna.’

If the verb is the final item in a p-phrase, it will trigger downstep on the following word. This is shown in (4) where (L) triggers downstep on the subordinating conjunction *àtè*.

- (4) /mwànèkì(L) è:sírìà(L) àtè né ndò:niré(L) moyèràniá ðéinè wá jòmbà/
 (mwànèkì)_φ (⁺è:s-írì-à)_φ (⁺àtè né nd-ò:n-iré mó-yèràniá)_φ (⁺ðéinè wá jòmbà)_φ
 Mwanĩki SM-think-FV that FM SM-see-PFV.FV 1-examiner inside of 9.house
 ‘Mwanĩki thinks that I saw the examiner inside the house.’
 (Clements & Ford 1981, 327)

The example in (4) also shows an important point regarding the source of the downstep. In (3), it is unclear whether it is the lexical floating tone or the phrasal one which triggers downstep. This is disambiguated in (4). The source of the downstep appearing on *ðéinè* in the embedded clause can only be the phrasal (L) because there is no adjacent lexical (L) that could trigger downstep in that position. This indicates that the phrasal (L) shifts from the underlying position to the surface position where it triggers downstep. Evidence for the noun not having an underlying lexical (L) is shown independently in (5) where *moyèràniá* is the final word in the p-phrase. Downstep is *not* triggered on the H-toned copula *né*. If a lexical floating L tone were present, it would trigger downstep as it does in (6).

- (5) /moyèràniá né(L) mwèyá/ (6) /nǝðyóná(L) né(L) mwèyá/
 (mò-yèràniá)_φ (né mw-èyá)_φ (nǝðyóná)_φ (⁺né mw-èyá)_φ
 1-examiner COP 2-good Njũgũna COP 2-good
 ‘The examiner is good.’ ‘Njũgũna is good.’ (Gjersøe 2016)

Another relevant tone rule is ‘Flattening’ which lowers an utterance-final H tone (Clements & Ford 1981). This applies to the final rising tones in (3b) and (4). If a floating L tone, however, is utterance-final, it blocks Flattening from applying to H tones or rising tones. This is the case for (3c), (5) and (6). In the two latter examples, the phrasal (L) has shifted to utterance-final position as also seen in (4). In this position, it blocks Flattening.

To summarize this section, lexical and phrasal floating L tones trigger downstep in the configurations (i) H)_φ⁺H; (ii) L)_φ⁺H; (iii) L)_φ⁺L. They have two different strategies for this. While the lexical (L) gets deleted whenever it is p-phrase-medial, the phrasal (L) moves from the underlying position adjacent to the verb, to the right edge of the p-phrase where it triggers downstep.

3. Cyclicity and High Tone Spreading

If a floating L tone appears in the tone sequence $/H)_\phi(\underline{L})L/$ (where ‘ \underline{L} ’ can be either the phrasal or lexical tone), no downstep is triggered on the L tone regardless of it being positioned at the right edge of a p-phrase. Instead, the floating L tone will move to the right triggering downstep on the first H tone it encounters. HTS then applies to the L tones in this p-phrase which precedes the now downstepped H tone. This process changes a sequence like $/H)_\phi(\underline{L})LLH/$ to $[H)_\phi HH^+H]$ as shown in (7). Note that $/H(\underline{L})\emptyset/$ and $/H(\underline{L})L/$ are treated here as the same because it is assumed that toneless syllables receive a default L tone. Downstep is triggered p-phrase-medially on the underlying H-toned syllable *sí:* of the adverb *ro:sí:ně* (7a) and on the H-toned syllable *γó* of *ηζόγóná* (7b). HTS applies on the preceding L-toned syllables. The two examples can be compared with (3b) and (3c) in section 2 where downstep *is* triggered on the right edge of the p-phrase because of the underlying tones being $L)_\phi(\underline{L})$.

- (7) a. $/nd\grave{o}:n\grave{i}r\acute{e}(\underline{L}) \quad \mu\zeta\acute{\alpha}t\acute{\alpha}(\underline{L}) \quad ro:s\acute{i}:n\grave{e}/$
 $(nd-\grave{o}:n-\grave{i}r\acute{e} \quad \mu\zeta\acute{\alpha}t\acute{\alpha})_\phi \quad (r\acute{o}:-^+s\acute{i}:n\grave{e})_\phi$
 SM-see-PFV.FV 9.star 11-morning
 ‘I saw a star this morning.’
- b. $/nd\grave{e}r\grave{a}:r\acute{o}r\grave{i}r\acute{e}(\underline{L}) \quad \eta\grave{\alpha}\eta\acute{\alpha} \quad n\grave{\alpha} \quad \eta\zeta\acute{o}\gamma\acute{o}n\acute{\alpha}(\underline{L})/$
 $(nd\grave{e}-r\grave{a}:-r\acute{o}r-\grave{i}r\acute{e} \quad \eta\grave{\alpha}\eta\acute{\alpha})_\phi \quad (n\grave{\alpha} \quad \eta\zeta\acute{o}^+\gamma\acute{o}n\acute{\alpha})_\phi$
 SM-NPST-watch-PFV.FV Ng’ang’a and Njũguna
 ‘I watched Ng’ang’a and Njũguna.’ (Gjersøe 2016)

If no H tone follows, the floating L tone will simply move to utterance-final position and remain floating without lowering any tones. Unbounded HTS then applies to the L tones which precede the downstepped H tone. Evidence of the presence of the floating L tone is that Flattening does not apply. The sequence $/H(\underline{L})_\phi L\dots L/$ surfaces as $[H)_\phi H\dots H(\underline{L})]$ (8). Crucially, unbounded HTS in Kikuyu only applies in correlation with a floating L tone and it opposes to binary HTS which applies between the verb and the object in (2), (3a), (3b), (4), and also (8). Because L tone is underlyingly specified in Kikuyu, I adopt the analysis of Philipsson (1991) where unbounded HTS can apply because underlying L tones have been deleted. Without deletion, only binary HTS applies.

- (8) $/\acute{a}h\grave{e}i\grave{r}\acute{e}(\underline{L}) \quad ke\eta\grave{\alpha}n\acute{i} \quad \beta\grave{i}r\acute{i}\beta\grave{i}r\acute{i}/$
 $(\acute{a}-h\grave{e}-\grave{i}r\acute{e} \quad k\acute{e}-\eta\grave{\alpha}n\acute{i})_\phi \quad (\beta\grave{i}r\acute{i}\beta\grave{i}r\acute{i})_\phi$
 SM-give-PFV.FV 7-crocodile 10.chillies
 ‘He/she gave the crocodile chillies.’

The examples in (7) and (8) differ from the examples shown in section 2. In (8), the floating L tone of the verb would be expected to appear on its immediate p-phrase edge. Instead there is evidence of it appearing final in the utterance on the successive p-phrase edge. In (7) the floating L tones fail to appear at a p-phrase edge. The question is then, why does

particularly difficult to perceive. The proposed constraint ALIGN(DS,R,P,R) (abbreviated ALIGN(DS,R)) in (13) prefers candidates with downstep at the right edge of a p-phrase. This is a gradient constraint where a violation mark is assigned for every syllable that intervenes between the downstep and a right p-phrase edge. The faithfulness constraint LINEARITY-T (LIN-T) in (14), based on McCarthy & Prince (1995), bans tone metathesis. It is also gradient and applies for both floating and associated tones. This means that a violation mark occurs whenever a floating tone undergoes metathesis with other tones. Crucially, if the tones which are crossed by the floating L tone are deleted, LIN-T is not violated because there are no tones to undergo metathesis with. The constraint REALIZE MORPHEME (RM) (Kurisu 2001) demands that distinct morphological forms should differ phonologically. RM will be violated if the phrasal $\textcircled{\mathbf{L}}$ gets deleted, because as mentioned in section 2, $\textcircled{\mathbf{L}}$ marks assertion. Deletion would therefore result in an assertive verb form having the same phonological form as a non-assertive verb form. The markedness constraint HAVE-TONE assigns a violation mark to toneless syllables on the surface. Finally, the three faithfulness constraints MAX|, MAX-L and MAX-H ban deletion of an association line, and deletion of H and L tones respectively which were in the input. The constraint rankings for both strata are shown in (16) and (17).

| (17) | Eval of i-phrase
*H ⁺ L, RM, HAVE(T), LIN-T, MAX-H ≫ ALIGN(DS,R), MAX , MAX-L | | |

The challenge for a parallel OT approach is that, on the one hand, there is evidence for the phrasal $\textcircled{\mathbf{L}}$ moving to the p-phrase edge according to ALIGN(DS,R); on the other hand, if it moves to the configuration H)_φ L, the constraint *H⁺L will force $\textcircled{\mathbf{L}}$ to trigger downstep in a position that can violate ALIGN(DS,R). Thus, *H⁺L must be ranked higher than ALIGN(DS,R). If this is the case, the crucial question is why $\textcircled{\mathbf{L}}$ is not simply placed directly in a position which does not violate *H⁺L to begin with. The central idea of the analysis is that in the first cycle, the position of the floating L tones is mainly determined by ALIGN(DS,R). The constraint ranking will generate a winner where the lexical $\textcircled{\mathbf{L}}$ has been deleted if it occurs p-phrase-medially in the underlying form. The phrasal $\textcircled{\mathbf{L}}$ can not be deleted because RM is high ranked. Thus, the winner will be the candidate where $\textcircled{\mathbf{L}}$ has shifted to the right edge of the p-phrase in order to satisfy ALIGN(DS,R). This is tone metathesis but because LIN-T is low ranked, it will be the winning pattern. Having

Cyclic Optimization of floating L tones in Kikuyu

the ranking of $MAX| \gg LIN-T \gg MAX-L$ is necessary to generate the correct winner for the lexical \textcircled{L} because deletion of associated tones is worse than deletion of a floating L tone. It is assumed here that RM does not penalize deletion of the lexical floating L tone because nouns with and without this tone are part of the same morphosyntactic category.

In tableau (18), the input has a lexical \textcircled{L} positioned p-phrase-medially between the noun and its modifier. If it remains in this position (triggering downstep), $ALIGN(DP,R)$ is violated (candidate (b)). If the floating tone moves to the right edge of the p-phrase across the lexical tones, it will violate $LIN-T$ (candidate (d)). This constraint will not be violated if the lexical tones which \textcircled{L} crosses are deleted as in candidate (a) and (c). This however violates $MAX|$ three times. Candidate (a) is worse than (c) because the syllables remain toneless violating $HAVE-T$ while in candidate (c), they get a tone through L tone spreading. The winner is candidate (e) which only violates the low-ranked $MAX-L$. The constraint RM is not violated here because it is a lexical floating tone (see definition of RM above). Deleting the lexical floating L tone is therefore better than realizing it in a p-phrase-medial position, or moving it to a p-phrase-final position by crossing either associated or deleted lexical tones. Note that the constraint $*H^+L$ will rule out any candidate where \textcircled{L} intervenes between a H and a L tone (e.g. if the noun would be H-final).

(18) *Cycle 1: Evaluation of the p-phrase (ϕ): 1-person 1-old (example (1) above)*

		$*H^+L$	RM	$HAVE-T$	$MAX-H$	$A(DS,R)$	$MAX $	$LIN-T$	$MAX-L$
L L \textcircled{L} L L L (mondo mokoro) ϕ									
a. L L \textcircled{L} (mondo mokoro) ϕ				***!			***		***
b. L L \textcircled{L} L L L (mondo mokoro) ϕ						*!			
c. L L \textcircled{L} (mondo mokoro) ϕ							***!		***
d. L L L L L \textcircled{L} (mondo mokoro) ϕ								***!	
e. L L L L L (mondo mokoro) ϕ									*

In tableau (19), the input has a phrasal \textcircled{L} positioned p-phrase-medially. If this tone is deleted, the high-ranked constraint RM is violated (candidate (a)). If it remains in this po-

sition (triggering downstep), ALIGN(DP,R) is violated (candidate (d)). In candidates (b) and (c), the H tones of the object have been deleted. This avoids violating ALIGN(DP,R) and the lower-ranked constraint LIN-T. However, these candidates are ruled out because they both violate MAX-H (and MAX|), and candidate (c) violates HAVE-T. The winner is candidate (e) where the floating L tone has undergone tonal metathesis in order to be at the right edge of the p-phrase. This violates LIN-T but it is low ranked in cycle one so the violation is not fatal. Note again that the constraint *H[↓]L will rule out any candidate where **(L)** intervenes between a H and a L tone..

(19) *Cycle 1: Evaluation of the p-phrase (ϕ): he-saw a.star (example (7a) above)*

	L LH (L) H H	*H [↓] L	RM	HAVE-T	MAX-H	A(DS,R)	MAX	LIN-T	Max-L
	(ndɔ:nirɛ pɜata) _ϕ								
a.	L LH H H (ndɔ:nirɛ pɜata) _ϕ		*!						*
b.	L LH (L) (ndɔ:nirɛ pɜata) _ϕ			*!*	**		**		
c.	L LH (L) (ndɔ:nirɛ pɜata) _ϕ				*!*		**		
d.	L LH (L) H H (ndɔ:nirɛ pɜata) _ϕ					*!			
e.	L LH H H (L) (ndɔ:nirɛ pɜata) _ϕ							**	

In the second cycle, the positioning of the floating L tone depends to a higher degree on the surrounding tones and LIN-T is high ranked. *H[↓]L remains the undominated constraint. If the phrasal **(L)** has shifted to the configuration H)_ϕ L, it will be forced into the following p-phrase to avoid violating *H[↓]L. This violates LIN-T unless the tones that the floating L tone crosses are deleted. Deletion followed by HTS is therefore considered a repair mechanism to avoid violating LIN-T and at the same time allowing **(L)** to move away from a H)_ϕ L sequence. In tableau (20), the input is the winner (e) from the first cycle which has the phrasal **(L)** positioned in the sequence H)_ϕ L. If **(L)** stays here, *H[↓]L is violated (candidate (a)). If it is deleted, RM is violated (candidate (b)). If it shifts across the tones as in candidate (d) and (e), this violates LIN-T. Candidates (c,f,g) do not violate this constraint because **(L)** crosses tones which have been deleted. Candidate (f) is conform with A(DS,R) but

Cyclic Optimization of floating L tones in Kikuyu

violates the higher-ranked MAX-H by deleting H tones. The winner is candidate (g) where only a L tone has been deleted. Contrary to candidate (c), this does not violate HAVE-T because HTS has applied. Note that the prefix is underlyingly toneless but is assumed to receive a default L tone in earlier strata at the lexical level.

(20) *Cycle 2 : Evaluation of the i-phrase: he-saw the.star this.morning (example (7a) above)*

	<i>*H⁺L</i>	<i>RM</i>	<i>Have-T</i>	<i>LIN-T</i>	<i>MAX-H</i>	<i>A(DS,R)</i>	<i>MAX/</i>	<i>MAX-L</i>
L LH H H L L H L H ((ndɔ:nirɛ̃ ɲʒata) _ϕ (ro:si:ne) _ϕ) _i								
a. L LH H H L L H L H ((ndɔ:nirɛ̃ ɲʒata) _ϕ (ro:si:ne) _ϕ) _i	*!							
b. L LH H H L H L H ((ndɔ:nirɛ̃ ɲʒata) _ϕ (ro:si:ne) _ϕ) _i		*!						*
c. L LH H H L H L H ((ndɔ:nirɛ̃ ɲʒata) _ϕ (ro:si:ne) _ϕ) _i			*!			*	*	*
d. L LH H H L H L H L ((ndɔ:nirɛ̃ ɲʒata) _ϕ (ro:si:ne) _ϕ) _i				**!***				
e. L LH H H L H L H ((ndɔ:nirɛ̃ ɲʒata) _ϕ (ro: sine) _ϕ) _i				*!		*		
f. L LH H H L ((ndɔ:nirɛ̃ ɲʒata) _ϕ (ro:si: ne) _ϕ) _i					*!*		*****	**
g. L LH H H L H L H ((ndɔ:nirɛ̃ ɲʒata) _ϕ (ro:si:ne) _ϕ) _i						*	*	*

The same mechanism applies in tableau (21), which shows the second cycle of the derivation. The input has an all L-toned noun which forms a separate p-phrase. The phrasal **L** cannot stay in the input position because it violates **H⁺L* (candidate (a)). Deletion of **L** is ruled out because of RM (candidate (b)). Moving across the L tones violate LIN-T (candidate (d)). Deleting the L tones of *βiriβiri* is the solution (candidate (c,e)) but the four syllables cannot remain toneless. Deletion followed by HTS is therefore the optimal output

(candidate (e)). The evidence of $\textcircled{\text{L}}$ actually being positioned in this i-phrase-final position is that it protects the H tones from being lowered thus preventing the rule Flattening from applying.

(21) *Cycle 2: Evaluation of the i-phrase: he-gave a star chillies* (hypothetical example with same tone pattern as in (8) above)

	$*\text{H}^{\text{L}}$	RM	<i>Have-T</i>	<i>LIN-T</i>	MAX-H	$\text{A}(\text{DS,R})$	MAX/	MAX-L

e. L LH H H $\textcircled{\text{L}}$ ((ndɔ:nirɛ ɲʒata) _φ (βiri βi ri) _φ) _i							*****	*****

5. Summary

This paper argued for the cyclic nature of floating L tones in Kikuyu. The proposal was a Stratal OT analysis with prosodic domains as strata. In Kikuyu, two post-lexical strata are needed. First, the domain-sensitivity of the floating L tones was derived in the p-phrase cycle. Second, the i-phrase cycle derived their tonal-motivated positioning. In this analysis, L tone deletion followed by unbounded HTS applies as a repair strategy which allows a floating L tone to move away from a banned tone sequence without undergoing metathesis.
